REPRODUCTIVE EFFECTS WITHIN ONE COHORT

A Can higher male ratios offset lower competitiveness?

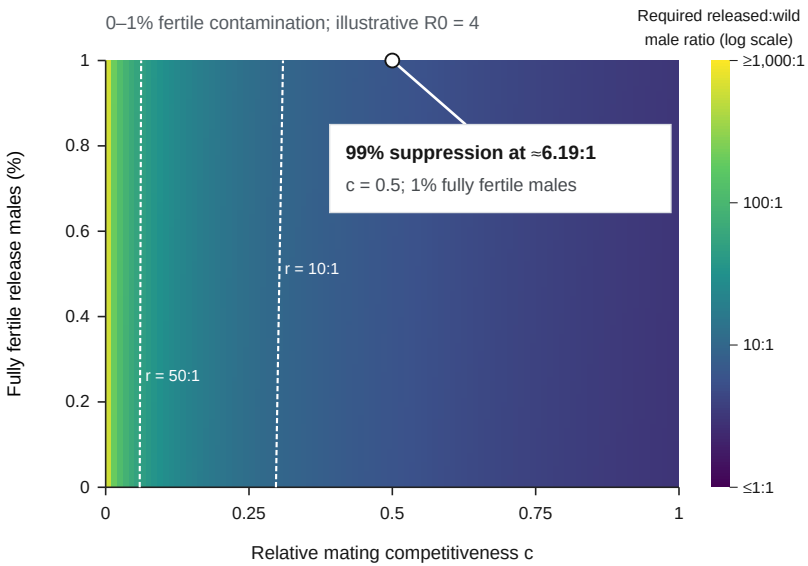

B How does fertility limit reproductive suppression?

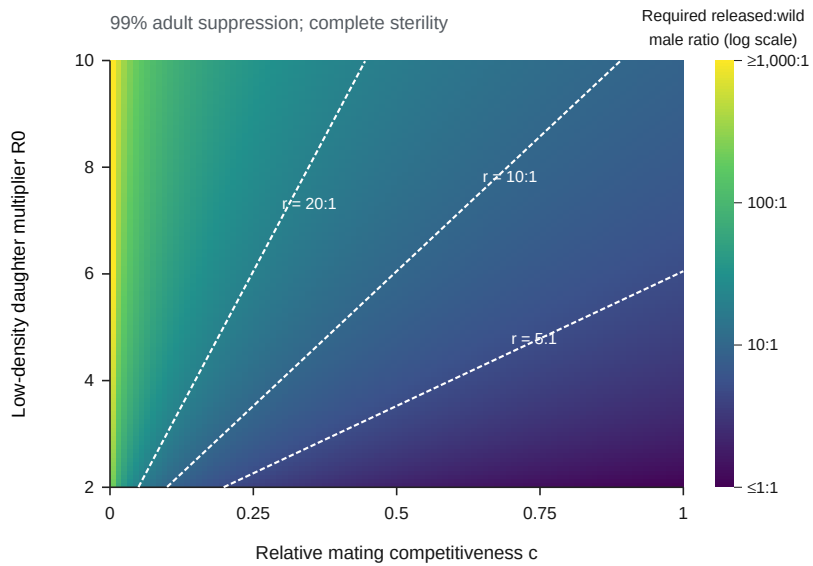

MODELED EQUILIBRIUM ADULT-POPULATION SUPPRESSION

C What ratio achieves 99% adult suppression?

D How does population growth change the requirement?

Across 0–1% contamination, competitiveness is the stronger determinant of the required ratio under the equal-competitiveness assumption.

All parameters are illustrative. C–D assume maintained effective male ratios, constant parameters and no immigration. Equilibrium targets do not establish extinction, time to suppression or field release schedules.
